

Master Amaierako Lana

Research Questions:

Contributions:

Sota:

- “Medical RAG” in 2025/26 EMNLP, ACL, EACL, NACL (proceedings)

Done:

- SNS1064 (ES), new dataset, 1064 samples:
 - Columns: Topic, Question, Short answer, Evidence, Additional considerations
- RAG model
 - Output: short answer, evidence, additional considerations
 - Methodology:
 - Reranker chooses best 3 docs and then LLM generates an answer with those 3 docs
 - BERTscore and Cosine similarity (cosim)

TO DO:

- Test baseline LLM only (Mistral7b instruct)
- Split SNS1064 -> train/dev/test
- Create new dataset with Casimedicos (ES)
 - Question, options, correct answer, reasoning
 - Format both datasets into: question, short answer, evidence
- **Dev** test, noThink
 - Spanish:
 - Baseline LLM only
 - 3x Few Shot (Random in domain Retrieval, to learn format)
 - Vs Medical Retrieval (???? maybe)
 - Vs Especialized Retrieval (in domain) Vs Retrieval (crossDomain) Vs Data augmentation
 - Agentic Reasoner:
 - agent 1: LLM only
 - agent 2: Best Specialized RAG from previous experiment
 - agent 3: Medical Retrieval (????)
 - agent 4: Judge Verifier Critic, takes both answers and creates a new one
- **Test**
 - ES: LLM only Vs Agentic Reasoner
 - Translate into Basque and test the model (ahal bada)
 - Model to translate datasets: HiTZ/medical_es-eu
 - Model for inference: Latxa (or Marmoka)
 - Tables measuring Cost Vs Efficiency
- **LLMak**
 - Qwen3.5:4b
 - think Vs nothink

- Gemma3 edo 4 (if there's time)
